

*When mounting the bracket to the yoke the screws should be put in from the top down, with the nut on the bottom. Lock washers have been provided to prevent loosening with use*

*Pro tip: attaching one side before putting over yoke makes it easier to attach the second side. Bracket should be loose enough to slide over first lip on yoke; Leave bracket loose until ready to mount on yoke. See image below*

***DO NOT OVERTIGHTEN!!***

*Bracket is meant to help stabilize and create a smooth yoke; we recommend tightening the left side one rotation, and then the right side; testing out the yoke each time to ensure proper fit. Over tightening may break bracket and put too much pressure on the yoke*

*Properly installed bracket should look like this upon completion*
